

Topic Modeling for Job Matching

Pang Hong Xiang

Problem Statement

Workforce Singapore manages a job matching portal (MyCareerFuture), which serves employers and jobseekers alike.

Employers complain that the applicants on the portal are not qualified for the jobs they are posting for.

However, they are not able to justify what they mean by “qualified”.

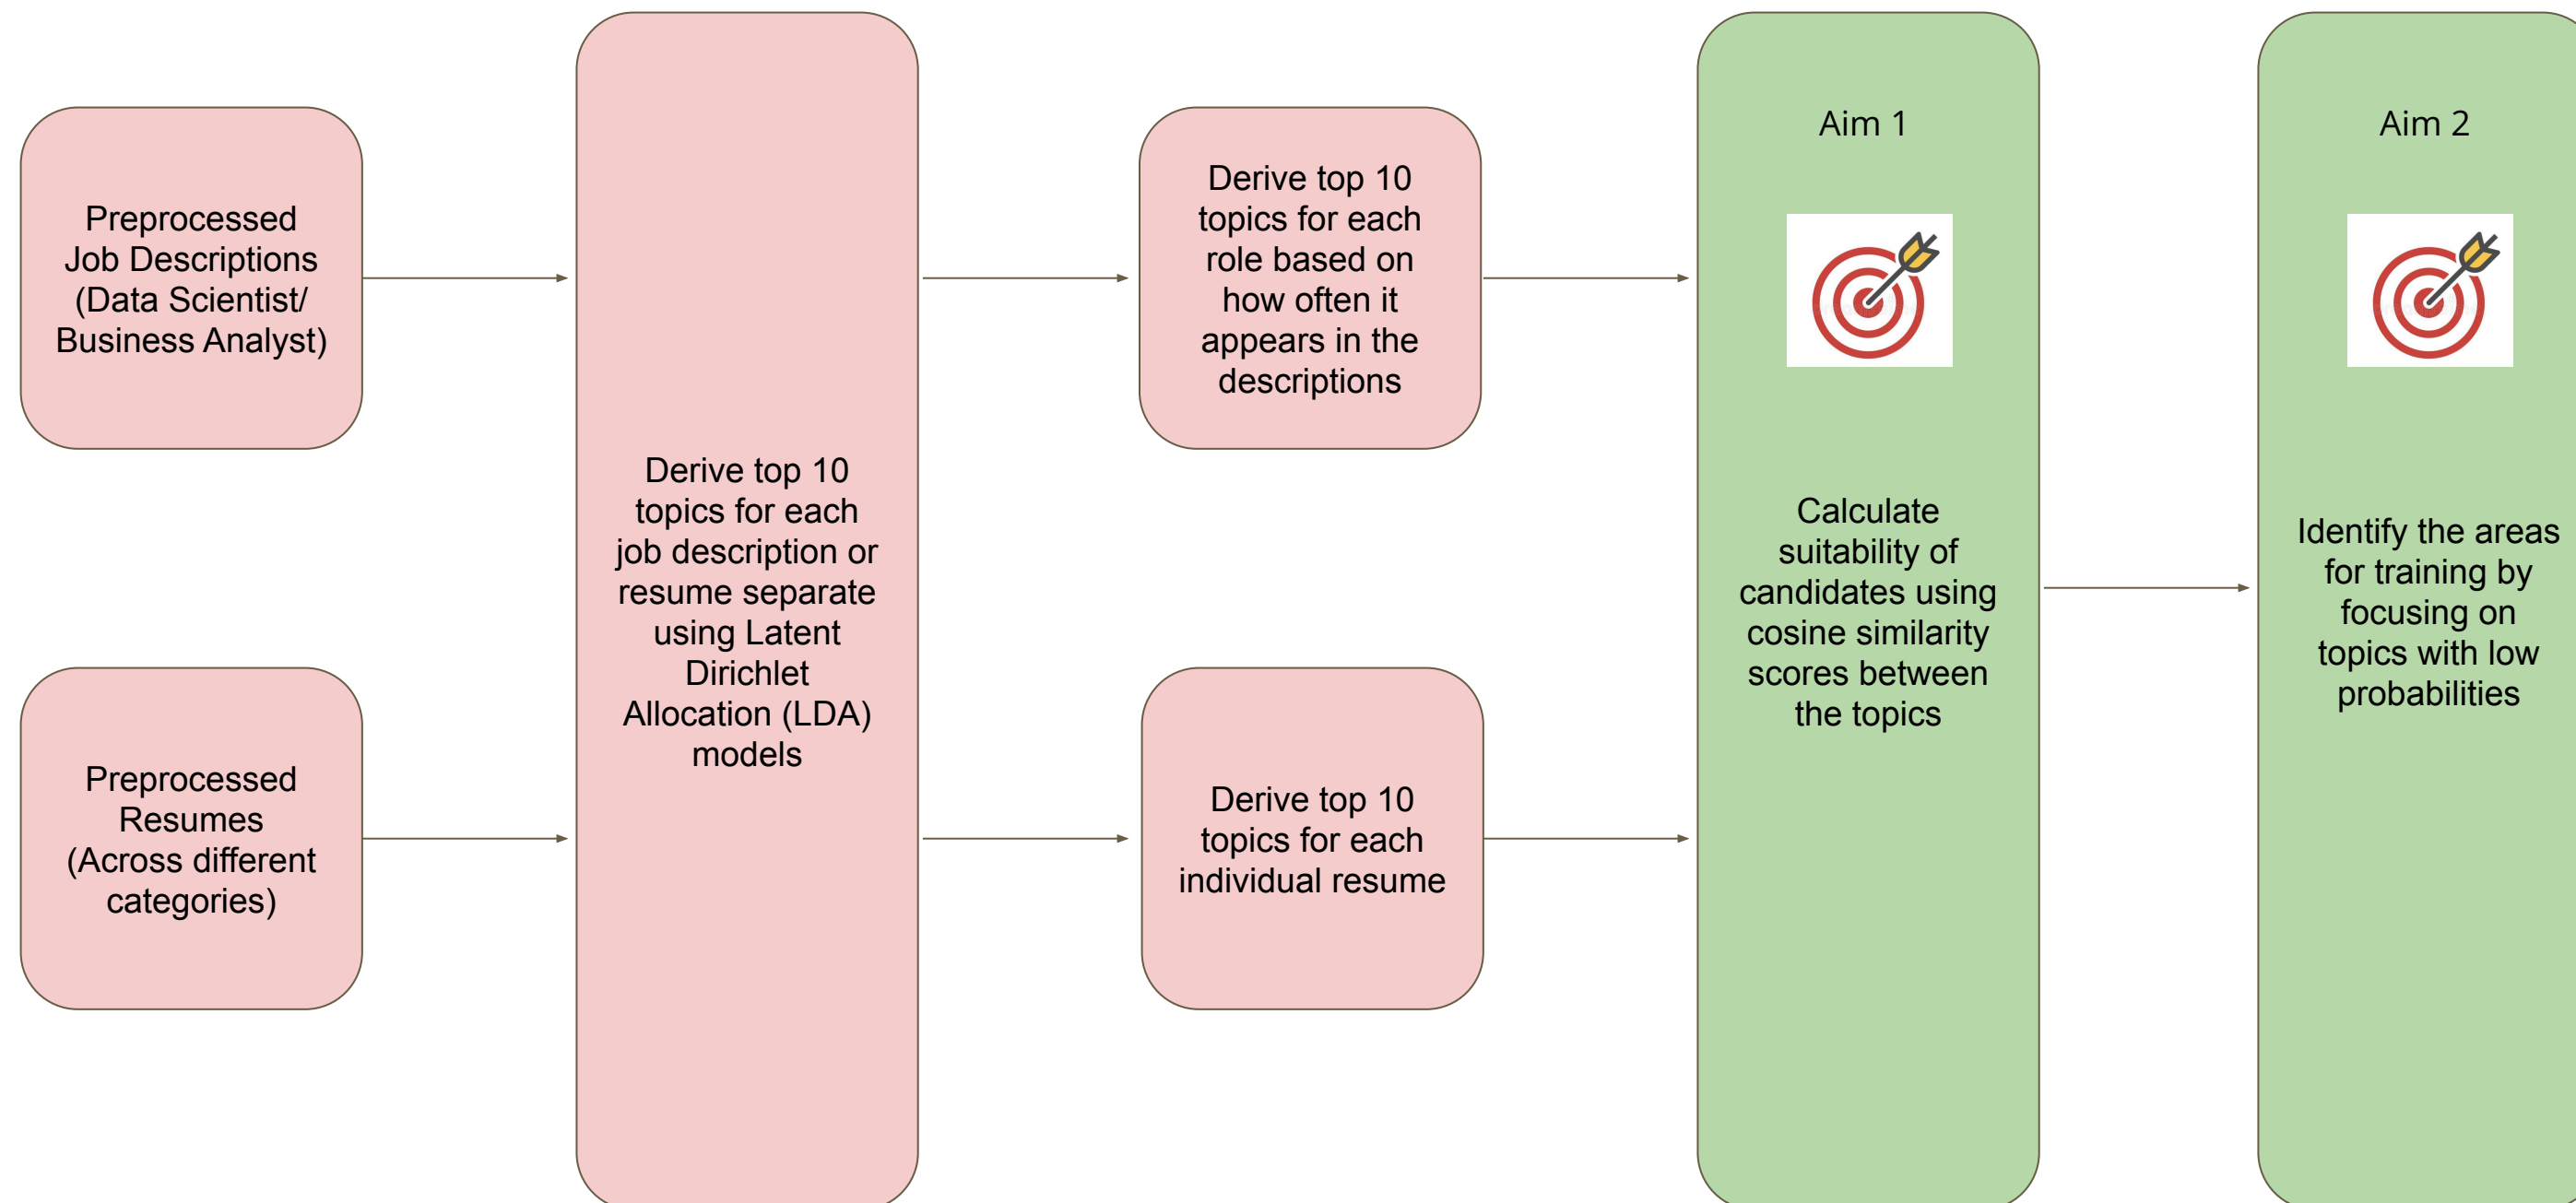

Aims of Project (Proof-of-Concept)

Quantify the suitability of jobseekers to recommend the most “qualified” candidates to employers.

Identify the gaps in quality of the candidates to recommend employers to focus their efforts on training post-hiring.

Methodology

Datasets

960 resumes across 25
categories

(<https://www.kaggle.com/datasets/gauravduttakiit/resume-dataset>)

100 job descriptions for Data
Scientist role

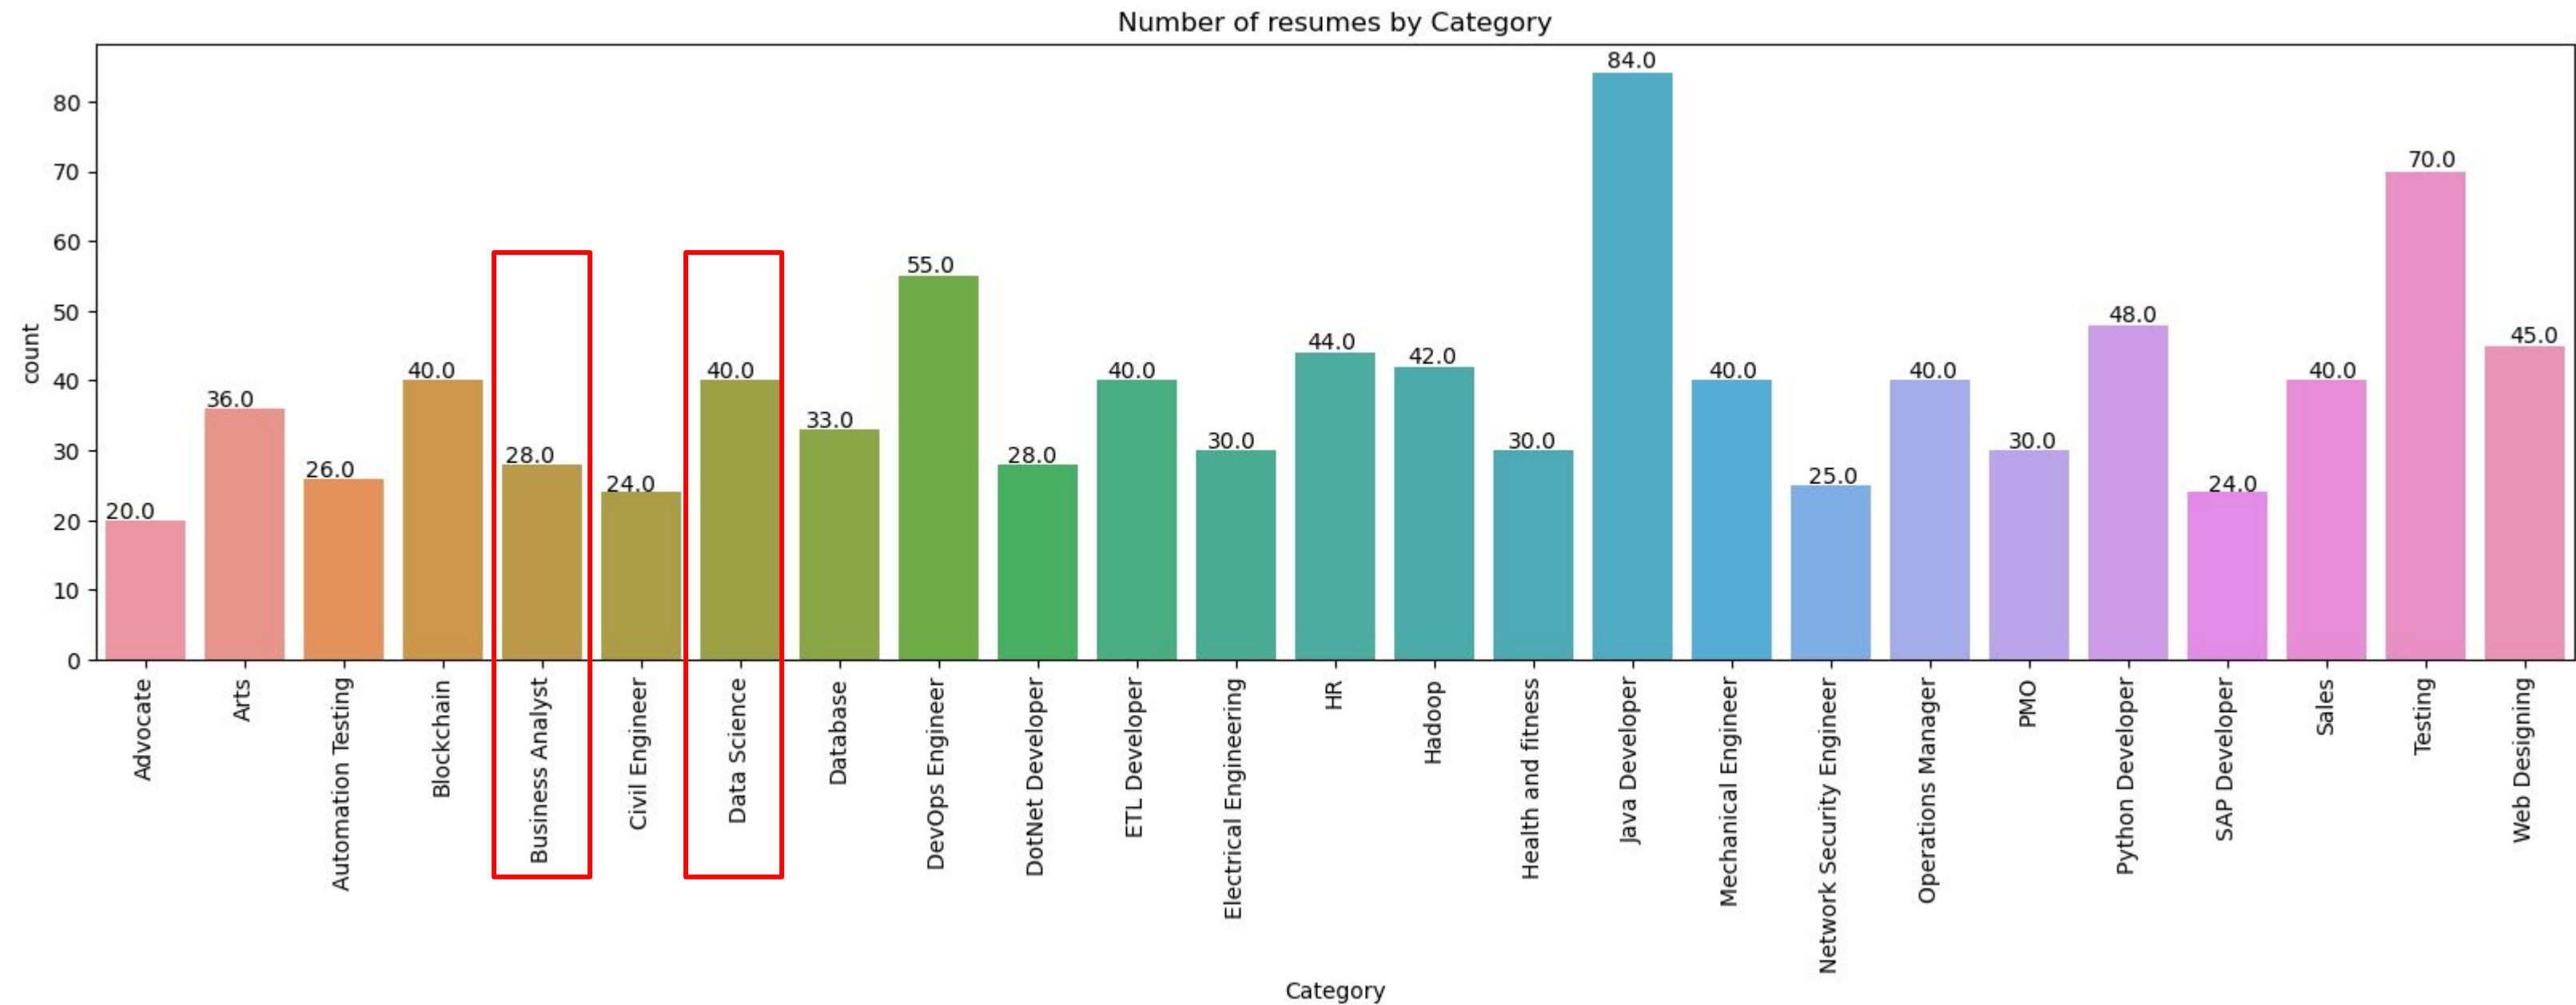

(<https://www.kaggle.com/datasets/andrewmvd/data-scientist-jobs>)

100 job descriptions for Business
Analyst role

(<https://www.kaggle.com/datasets/andrewmvd/business-analyst-jobs>)

Next Steps..

Limitations of POC

“Qualified” status using tokenized words and cosine similarity does not consider the position of the words in the resumes.

Topic modeling using LDA not effective, as it relies on bag-of-words approach without consideration for context.

The model captures topics but still require manual assessment of the bag-of-words to identify the nature of the topic.

Approach for actual project

Explore assigning different weightage to words based on recency of work experience

Explore using RoBERTa model to capture more complex language patterns and semantic relationships.

Explore mapping to the Technical Skills and Competencies listed in Skillsfuture Framework, which will allow us to identify and propose the post-hire training areas for employers to focus on.

Thank You
